
Subject: Use function pointer

Hi,

Actually this is not Scatter package issue.

I want to use Function pointer (Class pointer) to access internal variables from ScatterCtrlDemo.

From file tab14_userequations.cpp

```
ScatterDemo *ConstructUserEquation()
{
    static TabUserEquation tab_ue;
    return &tab_ue;
}
```

INITBLOCK {

```
    RegisterExample("User equation", ConstructUserEquation, __FILE__);
}
```

From file main.cpp

```
struct Example {
    ScatterDemo* (*ctrl)();
    String name;
    int index;
};
```

```
Array<Example>& Examples()
{
    static Array<Example> x;
    return x;
}
```

```
void RegisterExample(const char *name, ScatterDemo* (*ctrl)(), String fileName)
{
    Example& x = Examples().Add();
    x.name = name;
    x.ctrl = ctrl;
    x.index = ScanInt.GetFileName(fileName).Mid(3, 2));
}
```

Now with RegisterExample static TabUserEquation tab_ue gets added to Examples Array as Type ScatterDemo.

I want to use tab_ue in other part of code.

How to declare it so that it will be part of Examples Array and available independently.
