Instead of additional column, you can use a user defined function:search * from some_table where normalize(name) like '%jeremy%';
You'd of course need to call the same normalization function on the input as well.

This would give you a workaround around the problems with LIKE, without adding more data to your database (for the price of some CPU cycles). But you'll still need to write the code to strip the accents. I think that Mireks work on unicode decomposition might help with that a lot.

Best regards,
Honza
