Hello akebee,

`HttpRequest::Trace();` // Simply invoke this method.

In `Inet.h`, you can see that `HttpRequest` has several static trace methods with different levels of debug information:

```
static void Trace(bool b = true);  
static void TraceHeader(bool b = true);  
static void TraceBody(bool b = true);  
    static void TraceShort(bool b = true);
```

Best regards,
Oblivion
