Do this:

- 1) Install make environment (apt-get install build-essential)
- 2) get upp sources
- 3) make theide (command make in dir ide)
- 4) copy theide to folder /usr/local/bin or /home/pi/bin
- 5) run theide (may be from command line)
- 6) make U++ assemblies (left pane during package selection)

then you may compile on raspberry directly.

It's very simple way.

For real cross-compile search google for "raspberry qemu emulator".
