That works well, thx mirek.

Can I assume that `AddKey()` and `AddIndex()` effectively adds hidden columns that I then can access through column-order-index?

e.g.:

```
ar.AddIndex(); ar.AddColumn(); ar.AddIndex();
```

and I can access these with:

```
int idx=ar.GetCursor();
if (idx>=0)
{
    int first_index=ar.Get(idx, 0);
    int first_data=ar.Get(idx, 1);
    int second_index=ar.Get(idx, 2);
    ...
}
```
