Subject: [REQUEST]: Allow callback() template to work also with non-void and non-bool return types.

Hello,

It seems that callback() template function isn't working with return types other than bool or void. Is this intentional? Or is it possible to replace it with a more flexible one?

If so, maybe the below template function can do the job (IF I am not missing something here).

```
template<typename Res, typename... ArgTypes>
Function<Res(ArgTypes...)> callback(Res (*fn)(ArgTypes...))
{
 return [=](ArgTypes... args) { return (*fn)(args...); };
}
```

Best regards,
Oblivion
