Hello,

I believe the continue integration is not the problem. I don't know the setup of the <https://www.appveyor.com>, but it should be easily configure from the Windows and Linux level. First of all you need to deliver something that will build your application. The best tool for doing it is definitely UMK. After launching build your main project to check that compilation works fine and after that build your unit test project and run it. You can even use my Google Test and Mocks plugin to follow TDD with U++.

In my opinion you will probably lost day maybe two to invent how to handle continue integration on that site with U++. If you manage to do that don't forget to write something here - how to do it. It will be the great gift for the community.

Of course, I also forget to mention that this is brilliant idea to rewrite your application with U++.

Sincerely and good luck,  
Klugier
