luzr wrote on Thu, 24 August 2006 10:04 Sometimes BLITZ can hide errors in header arrangement. E.g.

file1.cpp:

```
#include <CtrlLib/CtrlLib.h>
```

```
....
```

file2.cpp

- missing #include

When compiled as single BLITZ block, missing header is second file problem is ignored (because it gets included in first file).

I guess this one is similar.

Mirek

sorry,my fault,I fixed it just now,I didn't add a new package,just add all files to main package.  
now I creat a new package name as SQLite.  
everything is fine
