Subject: DropDownList with "quick trigger option": best way to implement?

I want a DropDownList which triggers an external action not only when the widget view is clicked (OnClick) but already when a DropDownList item is selected (list.WhenSelect).

It is quite easy to achieve this by deriving MyDropDownList from DropDownList and overriding Select().

But I don't like this solution. It appears too complicated. Above all good C++ policy forbids to override non-virtual base class functions and Select() is a non-virtual function.

Is there a simpler or at least "cleaner" solution?

Werner
