part2 is in next/prev post!

Added sample for simple upp menu - chk down.

bugs:

gfxBackClr-onLoad Cannot load image, multiSelect moving with keys delayed info, F4 afterCreation bugs,

deletingObjs glued were not free'd, gluedObjs now works properly,MouseRClick can now directly select item

gfxObjs:

now when setting properties, all selected are modified, previously only cmdCtrl used that added:

editor tabs'n colors'n tab/font size, \$<esc{(p1=22,p2=3.14,p3="anystr")return ""}> parameters to pass

to escFile added - demo too(esc-params-call.txt.all),

added:

2ndPassParse added to support \$<esc..> @... in them before they are called anyfile.esc //opt=noParse! optional at 1st line added to notParse @... in script but to optionally pass @... with return to main parsing func and parsing it there - usefull to return any @..., @tid-str "title" which is optional - added

added:

abbreviations(configFileToltToo),eg: ---class(or...class)'[Ctrl-]Enter' - check snippets/abbrev-exp.esc,snippets/cpp/abbrev-exp.esc, and sample how to use them with esc in esc-params-call.txt.all

added:

Zoom/offset for gfx window - check Vector? controlS - MMButton can also be used added(uppMenu):

Check snippets/cpp/upp/SUGCMenuToolbarTest-ign.7z for already created menu with it. To manually see how it works: open menu-generic.gfx and upp-menubar2.h.all then Export. It should produce upp-menubar2.h header file - can be redirected to some folder(drawers cfg).

AltShift+SnippetClick: on '<<=...' adds fileNamesOnly, while clicking on file edit's it - doc'ed in Help.

InEditor :> (whenWaitingForOutput) is buggy
