I compiled your DateTimeCtrl package and it works fine after removing reference on String in line 473 in DateTimeCtrl.cpp. I compiled with version 608.r21.

By the way, I had to change the image file location #define and the layout file location #define from relative to absolute spec, because they could not be found. Is this normal or does this effect only exist due to the fact that I have the DateTimeCtrl package in a totally different directory tree as the upp sources?
