So I'm preparing a VM right now with a 100% legal Windows 10.

Could you please provide some semblance of what the installation steps should be. There used to be some instructions on the site but right now I can't find them. Probably because auto-detection doesn't work.

Then I will replicate the steps and show auto-detection results.

Two first choices should be VS 2015 and VS 2017 community edition, right?
