cbpporter wrote on Tue, 30 January 2018 16:26Second bug/weird feature:
d.Accept(MyDnDName) will set the data for "d" to the correct string + exactly 4 '\0' characters.

Needless to say this messes up all hash searches.

Actually, that is the reason why it did crash (with some more problems in GetTextSize).

The example should be now fixed. The moral of the story is that PasteClip can return zero padded data.

Example now fixed in trunk.

1. you have control over that format ID. Use it :) Also investigate InternalClip etc

2. You do not need to Insert at the position it suggests. E.g. get parent node and add to it.

3. Yes.
