- Windows is mature

- Most of Linux problems of past (e.g. printing or PdfDraw) are now resolved. (still missing is OpenGL support). FreeBSD is I believe the same thing.

- PocketPC is under development, I hope that next big release will be able to announce support

- MacOS is still in plans. With the current PocketPC experience, I dare to say that it will need no more than two months, however I do not think there will be MacOS in next release (unfortunately).
