Hello,

The problem with cross compilation is that GCC or MSCV like build methods targets current operating system. This is why -DflagWIN32 flag is added. Without chaining ide source code it will not be possible.

Cross compilation with TheIDE is possible. I manage to did it in the past by providing Android builder. It can be build from Windows and Linux and targets different architecture like x86, ARM & MIPS.

Pipcoprof, please read my post when I explain how to build ide on raspberry pi. Currently, this is the only reasonable way for you.

Sincerely,
Klugier
