Hello,

I lost (accidentally deleted ) my makefile that linked statically the stdlibc++. I tried to create a new makefile (to be patched with my option) but I was unable to reproduce the same setting. The previous good makefile compiled the package in the folder:

GCC32-Gcc32-Gui-Linux-Main-Shared

Does anybody know which are the (principal) build setting parameters in the IDE to generate such output folder?

So far I switched among shared, static and son without success... each time the output directory was different.

Thank you

Luigi
