Hello There,

Today I want to share you a problem I got on my new computer :d .
Since I tried U++ I fell love with it. So when I got my new computer,
after a few windows update, I decided to download the last U++ build (upp-mingw-12176.7z).
Then just to try my new Processor (Ryzen 7 2700X) I decided to compile a random package   :d .
And Here came the nightmare : after 0,06 sec of compilation "there were errors" and nothing else.
Do you guys got any idea of how can i fix it ?

thank you in advance.

Have a good day.
