I wanted to ask you if it is possible to develop web pages in U++ under a MS IIS server in an intranet with Windows authentication.

I know it is possible to have an ASP.NET application in C# or VB, connected to the U++ application. However I would prefer that the U++ program would handle the processing and the web user interface.

Short answer - yes, Tom did it like 12 years ago...

Long answer - is just too long :)
