Subject: Re: How to manage the access to a Db on an unstable connection
Posted by Giorgio on Tue, 23 Oct 2018 08:46:36 GMT

Hi Zbych,
thank you for your suggestions.

My routines that deal with the database have all the same structure:

```
int SaveData::TotalDrums(String c)
{
 int retval;
    SQL.ClearError();
 try {
  retval = SQL % Select(SqlSum(DRUMS))
   .From(MYTABLE)
    .Where( MYFIELD == AsString(c) );
 } catch(SqlExc) {
  retval = -1;
  ErrorOK(t_("Error: ") + SQL.GetLastError());
 }
 return retval;
}
```

Do you think I should catch also something else?
Is there on the upp site some documentation on ConnectionOK etcetera? I found almost nothing.
Regards,
gio
