I found the problem!!
The genearated .exe takes about 200MB and during compilation it needs hundreds of MB!
I was running In virtual box and although with 900MB free it was not enought to compile the big project :)
I have increased VM disk space in order to install another app and i tried to compiled upp app gain and now with success!

I thought that presented error was related with RAM but it seems that it is realted with disk space (or not) ?! but now it compiles also over windows and over Linux

Upp is great!!

Thanks
