I like upp and theIDE, though I cannot afford to switch the current dev environment (at least not on permanent basis).

So I started to "convert" some of the projects to Microsoft Visual C++ workspace (ie. sln and vcproj files).

Attached zip with working setup for several upp libraries and examples. I had to change several default settings to get it to link in release (ms linker was crashing otherwise, seems like a bug in the whole program optimization/link time code generation).

The project files are done against version upp-win-605 since at the time latest svn was broken.

Anybody cares to follow up with eclipse version?
