Subject: CoWork usage question Posted by Tom1 on Tue, 22 Jan 2019 13:59:18 GMT View Forum Message <> Reply to Message

Hi,

As I need more than coffee to solve this out, I decided to put it here :)

The question is: What am I doing wrong, as the following code does not work as I expect, i.e. multiply the items by two and show the results: #include <Core/Core.h>

```
using namespace Upp;
#define ICOUNT 15
class A{
public:
Buffer<int> ib;
A(){
 ib.Alloc(ICOUNT,0);
 for(int i=0;i<ICOUNT;i++) ib[i]=i+1;</pre>
}
void operation(int &x){
 x*=2;
}
void operationp(int *x){
 *x*=2;
}
void Run(){
 Cout() << "ib = ";
 for(int i=0;i<ICOUNT;i++) Cout() << ib[i] << ", ";
 CoWork co:
 for(int i=0;i<ICOUNT;i++){
 //co & [&] { operation(ib[i]); }; // Reference variant
 co & [&] { operationp(&ib[i]); }; // Pointer variant
 }
 co.Finish();
 Sleep(400);
 Cout() << "\n\nib*2 = ";
 for(int i=0;i<ICOUNT;i++) Cout() << ib[i] << ", ";
 Cout() << "\n\n";
}
};
```

CONSOLE_APP_MAIN { A ac; ac.Run(); }

Mostly the results are 'exciting' to say the least.

Best regards,

Tom
