Well, the second cup of coffee solved it for me:

```
CoWork co;
for(int i=0;i<ICOUNT;i++){
    //co & [&, i] { operation(ib[i]); }; // Reference variant
    co & [&, i] { operationp(&ib[i]); }; // Pointer variant
}
co.Finish();
```

Must have 'copy capture' for i, or otherwise the index i will run away before used.

Sorry for bothering with such trivial issue.

Best regards,

Tom
