Subject: get debug info after intermittent crashing of theide

(I don't know where else this should be posted)
(running on Linux)
At very irregular intervals theide crashes with "invalid memory access"
It happens, as far as I can remember, after I've compiled my app (in DEBUG)
and then click on the 'Execute'-button - my app still runs, but theide dissappears
(It happens with different apps at any stage of developemnt, not just one)

What can I do to get theide to log it's state & call-trace when this error happen?

(A last resort, because it is very intrusive, will be to run theide itself in DEBUG
but I would first like to try easier / less hassle methods before I go there.)
