Full - updated preview version,
part1 is here, part2, part3 and any patches are in next/prev post!

Some fixes/addedCode:

- * projects now have separate included/opened files(small add/remove dlg), extensions can be specified in *.tool
- * there is now output window for project which use compilation and clicking on possible file/line error via plugin
- * rtf/qt4 bullet reOpen indentation bug fixed thanks to mirek and underlying code

This is previewVer, but basic things are there, so jet to polish:

- outputWindowPlugin: ascii only, should use at least wchar_t, mainly not because of no wide regex
- sorting files in project dialog, for now - prj/ses files can be manually edited via editor
- basic compilation works, CMake and others not checked

InEditor :> (whenWaitingForOutput) is buggy
and going fullscreen(with plugins) is buggy because underlying windows are destroyed
Editor's richedit still set IsModified somewhere(asks to save even if not modified)

Start completely afresh, don't just override previous version!
