slashupp wrote on Sun, 24 February 2019 11:18(Im using svn 12781)

word-wrapping code-lines: this happen consistently when I have a long line and type beyond column 96/7 then

the input-point suddenly jump to an indented new line below

This must be something really specific, maybe some bug triggered by something special in the line. (I have just tested and it does not happen normally).

Would it be possible to show me screenshot after this happens?

Quote:

navigator: I agree it must be available, but to the left of the editor as per the original default, when it is to the right I find it not helpful/interferes with my visual feel for the code and I always change it back to the middle/left of the editor, which is what I'm saying should remain the default location

Well, my reason for having it right is that I want to have text in proper center, not look right all the time.

All in all, this is debatable, so I will stick with my instinct for now. If anybody else complains about this, I might change the default...

rescan file while editing: this is maybe just part of the start-up process of the ide, and maybe I'm too quick

into editing for it to have finished scanning all sources used; after a project is open a while this becomes less of an issue, I have not timed it, so maybe I should just be patient for the few minutes it

takes the ide to set itself up - I'll monitor it and report if it persists

Have you ever tried to start Visual Studio? :)

Mirek
