Hello Community,

Today, I'm facing a problem.

I'm actually developping software dedicated to processing a lot of data extracted by itself.

Problème is, in my actual developpement environnement I can't have kind of standard way to store the data.

So the question is : How you guys would deal with this kind of constraint ?

And, if one of best way is storing data into Xml/Json, do you know if Upp have a Mechanism allow us to retrieve some particulare data really quickly from this XML like an sql requete would do on a classic database ?

Thanks in advance !

Have a good Day !

Xemuth
