I haven't seen VS for long time, but unless they removed it completely, it's maybe possible to use `umk` as project build tool.

Although that doesn't itself make the project management easier, depends, what you need and how you update your project, not sure if with umk you would have to manually keep ".upp" project file up to date, or it would be possible to extract that from VS project data.

Another option is as usually, go to TheIDE, switch "verbose output" ON, do the full rebuild, store the logs and then do the verbose builds in VS and look for differences.
