Setting the Ctrl::host to localhost was sufficient.

Thanks a lot!

I didn't realize that Ctrl::host is used to connect back from JavaScript to a server.
I still have several problems like I cannot create more than one connection, although Release configuration is forking. And WebWord is using 100% of CPU because it is spinning in a connection loop which doesn't have any timeouts.

Are you experiencing the same problems or is it something related to my web-server setup?
