Edit:
Dont mind.
I have now found, the problem is already solved.
It is already possible to define a usertype based on a template e.g. WithEnterAction<EditString> in
the Layout editor.
In this case all options of EditString are available.

This feature however seems to be undocumented and without tutorial or example and not
discussed in the forum.
So I needed some time to find out.

I hope, this helps new users:

All the best,

Peter
