In case of HPAGE = 256 it is starting to use tens of gigabytes in just a few seconds ...
In case of HPAGE = 8192 it is using 2.0% RAM max (~646Mb) one one (some data is read from disc into memory) run
and 2.2% RAM max (~714Mb) on another run (all data is cashed in memory).
Well, "top" is not the best tool to check memory usage.
