That's mean I can do near the same code between linux and windows ? or dll in windows and linux don't have same architecture ?

Linux and Windows have similar architectures.
DLL-related functions have different names, but they do pretty much the same thing.
You just need to write a platform-independed wrapper for them.
This is a trivial task.
DLLs on Windows and Linux behave slightly differently.
Main source of information for you should be man ld.so
Read it carefully.
Other useful apps on Linux: ldd, nm.
Start with man ldd and man nm

Hope this helps.
