It would be nice/useful to have theide update version-numbers with each successful compile of a package.

With version numbers in the form release.build.test, theide can increment 'test' with each successful compile in Debug-mode, increment 'build' when compile succeeds in Release mode, leaving 'release' to be adjusted by the developer - possibly in Project:[package organizer] or [Main package configuration]

Then have macros available to get these from code, to keep in a variable for later use e.g.: to version-stamp data saved to file or db so that later releases/builds can correctly interpret the data-structure.
