Quote:Why the code below is working the way it is working (printing out "Hello from A" instead of "Hello from B")?

That's because we didn't define any destructor on B.

This is not a correct answer.

Since B inherits from A, B will call A's destructor right after execution of its own destructor.

This particular statement is correct, but Hello() is a virtual method and it is supposed to print "Hello from B".

```
B b;  
A* a = &b;  
a->Hello();
```

This code will print "Hello from B".

Why the code in quiz is working differently?
