HI all-

I am very puzzled. i want code to activate on tab WhenSet, and then to identify which tab is the current tab.

Am I doing something wrong?

```
tab1.Add(eventGrid.SizePos(), t_("Events"));
tab1.Add(dateGrid.SizePos(), t_("Dates"));
tab1.Add(sqlArr.SizePos(), t_("Tasks"));

tab1.WhenSet = THISBACK(ManageMenus);

void CantonEdu::ManageMenus() {
// TabCtrl::Item & tabItemZero = tab1.GetItem(0);

int n3 = tab1.Get();
bool n2 = tab1.IsAt(eventGrid);

// PromptOK( "" + n3);
// PromptOK( "" + n2);
//n3 and n2 do not return anything (blank dialog msg window).
// cant use tabItemZero because I can't pass in an int like n3 to GetItem;

// NOTE this function doesn't really do anything (yet). It is a mishmash of pseudo code.
// I used examples of Get and IsAt to communicate that the PromptOk dialog window returns
nothing.

}
```

I will check back in about 14 hours. I am at GMT -5.

thnx.
