
Subject: [solved]An U++ equivalent of bzero ? (if not a sin)

Dear gentlemen,

while messing with my toy proggy, I've reached a point where I need to initialize an array of "double" (the double-length floating point type) - as an accumulation buffer of sorts.

Defined roughly as

```
double my_accu_buf[SOME_PARTICULAR_INTEGER_SIZE];
```

Can I just use the bzero() function that I know from GNU Libc? The MinGW compiler behind U++ cannot find that function, even if I `#include <strings.h>` . Ahaa, `memset()` does work (I don't even need to `#include <string.h>`). It's true that "man bzero" says "nono, deprecated, use `memset()` instead". Or is there some U++ equivalent? Or, should I refrain from using the unsafe and ugly, plain old C arrays, and use some container template instead? Such as the `Vector`... And of course I can just iterate across the array, but that feels so *meh* :d

Come to think of that, if I zero-pad the storage allocated behind a "double", do I actually achieve the same as

```
double my_var = 0; // ?
```

Recommendations welcome :)

Frank
