The only problem with sqlite is when you select "stringed dates" into value and you want that value to be date type.

Now I use ScanDate which seems to work well.

Value dt = ScanDate(String(SQL[DT])); //DT column that holds date

```
Date ScanDate(String &s)
{
    if(s.IsEmpty())
        return Null;
    int year = atoi(s.Left(4));
    int month = atoi(s.Mid(5, 2));
    int day = atoi(s.Right(2));

    return Date(year, month, day);
}
```

But I agree that is troublesome and your chage is wanted.
