koldo wrote on Mon, 17 February 2020 09:11Hi Mirek

In plain text, the repository is the first place where changes are uploaded and a mirror is just a copy done regularly.

Is it U++ GitHub mirror anything different?

So all github repos are mirrors, as the first place where changes are uploaded is your local repository.

What I want to say here that 'mirror' does not have meaning with git. You have upstream and downstream. U++ github us definitely upstream.

Quote:

I think that standard GitHub Workflow (create branches, add commits, open pull requests, merge) is rather different than in U++.

Are we going to adopt this system, or are we going to continue with the current system?

This system is already adopted. The only difference is that I am not using automatic merging of pull requests in github, but I would not do that anyway - I want to check it first in local repo. But that is behind the scenes.

(A problem is that I lag accepting pulls - sorry about that, too busy lately working on chameleon / macos).

Mirek
