This is a patch - so download full 8.feb.2019 ver,
extract into some directory eg SUniGuiCreator, download and apply all patches, then download
this one also and overwrite it's base directory with this.

Some fixes/added code:
* Sample.prj file header hint corrected
* Added User Interaction for gfxItems - basic escScriptCommands are there - eg to create custom
gauges frontend/etc.
This can be added by Menu->Graphics-script(Shift clearsIt) and it's usage is saved with optional
projects/sessions.
Sample is ui-items-test.esc and key info is in escScriptKeycodes.txt.
Note.txt is updated to reflect this changes.

Yet to do:
-undo in gfx
-wideString output(does std:: support wideRe?), mainly if nonAnsi characters used in a path
