I have got an idea that umk in fact can be linked static, which means we can create universal binary for umk that would work on all linux distros (and looks like FreeBSD as well). That perhaps might improve out installation woes...

I am enclosing static build of umk ('umks'). I would welcome some info whether it runs on your distro.

P.S.: I am well aware this is sort of the same thing that long time ago dolik developed. However the problem was maintaining separate script that would have to reflect all changes in ide/Builders. This is just different compilation of the same thing.
