Wow, where did this sudden interest in a dead forum thread from almost exactly 6 years ago come from? :)

It was just a proof of concept, never put in real-world use. I don't even remember how it worked and I have no idea how many things changed in Skylark and U++ in general in those past six years. I'm not using U++ for the last few years :) I actually don't even use C++ much these days, my work shifted mainly to bash and Kotlin lately...

So it might be actually easier for you to fix the broken parts than it would be for me ;) I have glanced over the contents of the zip file and it seems there is nothing particularly tricky.

Quote:As I try to compile it, I was prompted that GetResponseCode, GetResponseCodeText, and GetURI are not members of class Http.

Those three functions were actually never in Skylark. They are in the Skylark.patch file in the zip archive and must be applied to uppsrc/Skylark/Http.h, as described in the original post.

Best regards,
Honza
