* openssl-devel on Fedora, on Redhat and on Mandriva.

- * libopenssl-devel on OpenSuse
- * libssl-dev on Debian and Ubuntu

* Nothing to install on FreeBSD (installed by default) but libcrypto.pc, libssl.pc and openssl.pc are missing

Thanks a lot. Looks like not moving everything to pkg-config was a good idea...:)

So I guess we have blind spot remaining now - pacman / ArchLinux and derivatives.... It unfortunately keeps crashing in virtualbox for me....
