This is a patch - so download full 8.feb.2019 ver,
extract into some directory eg SUniGuiCreator, download and apply all patches, then download
this one also and overwrite it's base directory with this.

Some fixes/added code:
* settimer added: can be for eg animations - which can be called through timer optional func
* ui-items-test.esc updated: also timer animation sample
Note.txt is updated to reflect this changes(settimer/stoptimer/uiRedraw).

Yet to do:
-undo in gfx
-wideString output(does std:: support wideRe?), mainly if nonAnsi characters used in a path
