Giorgio wrote on Thu, 16 April 2020 10:32Hi there,  
I've been using the MSSQL ODBC driver to connect to the database of a software developed by a third party. Basically, I have just to import a table, so just to read data. The database is hosted in a remote server managed by the party that developed the application and we connect to that server through a VPN connection. When the application I developed runs in the third party premises works perfectly, but when I connect through VPN I got the following error: "ERROR: Expected number: oft][ODBC SQL Server". The problem is that due to the sysadmin paranoia, they open ports in the VPN connections only if requested. I managed to have the sysadmin to open some port, so now I can use SQL Server Management Studio to access the data base (TCP port 1433), but the application I developed still doesn't work.

What are the ports I should ask to open to use MSSQL through U++?

Thanks,  
gio

If it works with SQL Studion, it should work with U++ too => problem is somewhere else.
