Hi all-

I'm running my very small application (it only has 5 or 6 dialogs so far). If I run code from my menu, I can run it with sql until I am blue in the face. When I start to open up other dialogs and switch back I get a msg. that says something about invalid memory access. I run a gui with a main section for my main window. This is the menu system to launch other forms. I'm using Ubuntu xfce. Any ideas why it works and then crashes when I am switching dialogs? Thnx - roboloki

```
bar.Add("check master", [=] { showmaster();});
bar.Add("check detail", [=] { showdetail();});
bar.Add("Account Maint.", [=] { showaccounts();});
bar.Add("Subsidiary", [=] { showciti();});
bar.Add("Purch. Journal", [=] { showpj();});
bar.Add("Exit", [=] { Exit(); });
}
void MyMain::MainMenu(Bar& bar) {
    bar.Sub("Menu", [=](Bar& bar) { SubMenu(bar); });
}
```

```
void MyMain::showaccounts() {
```

```
    // show check master
```

```
        App2 app2;
        switch(app2.Run()) {
        case IDOK:
            break;
        case IDCANCEL:
            Exclamation("Canceled");
```

```
    }
}
```

I use this code for each dialog with an okay and cancel button:

```
ok.Ok() <<= Acceptor(IDOK);
```

```
cancel.Cancel() <<= Rejector(IDCANCEL);
```
