Hello Deep,

In my application I have a folder resources containing my img /css / js / and even my custom fonts.  
to make allow user to retrieve it from their browser, I use this kind of path in my witz template :

...  
  
...

the real path of 404 img file on my server is ..../ressources/img/404.png  
To do the transformation the simple path on my witz to the real path I have this kind of handler in my Handler file :

```
SKYLARK(RessourcesHandler, "/ressources/*"){
    if(http[0].Find(".png") != -1){
        http.SetHeader("Cache-Control", "public");
        http.ContentType("image/png") << LoadFile(GetFilePath("ressources/img/" +http[0]));
    }else if(http[0].Find(".css")!= -1){
        http.SetHeader("Cache-Control", "public");
        http.ContentType("text/css") << LoadFile(GetFilePath("ressources/css/" +http[0]));
    }else if(http[0].Find("fonts")!= -1){
        http.SetHeader("Cache-Control", "public");
        http.ContentType("text/css") << LoadFile(GetFilePath("ressources/fonts/" +http[0]));
    }else if(http[0].Find(".js")!= -1){
        http.SetHeader("Cache-Control", "public");
        http.ContentType("text/javascript") << LoadFile(GetFilePath("ressources/js/" +http[0]));
    }else{
        http.Response(404,"File not found");
    }
}
```

I don't know if it is a good way of working but it work and allow me to easily manage all ressource I want to share
