In SQLite, I have fixed issue with crashing global SQL. In the process I have removed "prepared statement caching", as the prefered method of U++ is different - if you want to keep your statement cached, just make it survive for longer. E.g. make it static.

In the process I have also removed operator= from Sql and created new AppSql class for SQL with operator= (because SQL is the only use for operator= - used when defining the global SQL session).
