Hello,

I'm currently using Skylark to developpe my own website and I have a little doubt about skylark session.

On my website, I want user authenticate themself. so Actually I'm using a form with $post_identity() to start a session.
When user send is data to be logged on, I check if he is legitimate then, if he is, I do this :

```
if(Data sent by user is good){
   http.NewIdentity(); //Set new session identity
   http.SessionSet("RIGHT", AsString(us->GetRight())); //Set Right of user
   http.SessionSet("USERNAME", us->GetLogin()); //Set username of user
   http.Redirect(PrivateScreen); //Redirect to the privateScreen
  }else{
   http.Redirect(Auth); //Else redirect to authentification page
  }
```

On other page (like PrivateScreen) for example, I do this to ensure the user is connected :

```
 if( !http[".USERNAME"].ToString().IsEmpty()){
  ...Process everythings
 }else{
  http.Redirect(Auth); //Else redirect to authentification page
 }
```

Is this way of working is safe ? should I instead, generate a special ID related to sessionID of the user, send it to cookies and comparing it every time ?

Thanks in advance
