Currently, the double formatting comes from the operating system.

You can use language specific formatting using strings like "%2!n!". See "Text formatting" in documentation here: [http://upp.sourceforge.net/src\\$Core\\$Format\\$en-us.html](http://upp.sourceforge.net/src$Core$Format$en-us.html)

Additionally, you can use any formatting and "scanning" in widgets also, see the Convert classes.
