Dear Jakob

If your application is interactive, I would not unlink Scatter from data. That is the nice thing of having all coupled.

In case that you need, for any case, to unlink them, `SetDataSourceInternal()` does the job just once after all `AddSeries()` calls.

In addition, if your user updates the data, you would have to call `Refresh()`. If you unlink the data, you would have to call `SetDataSourceInternal()`, so this does not require additional lines of code.
